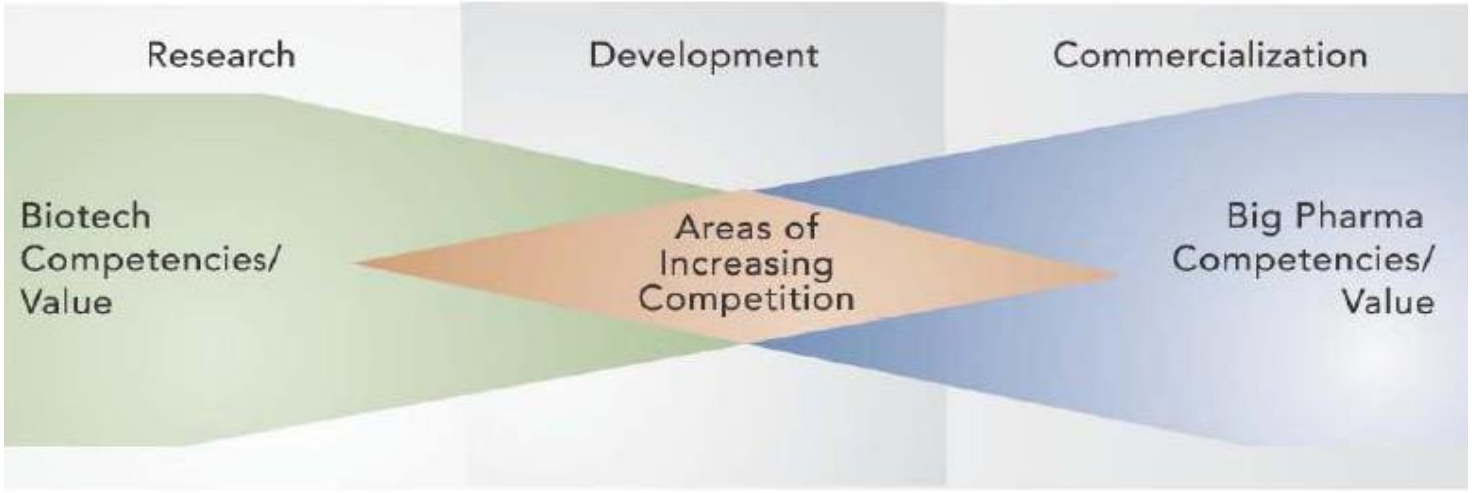
Typical Value Chain of a Pharmaceutical Product using Biotechnology

Discovery of the Product → Marketing of the Product



Top Ten Companies
In Terms of Market Capitalization

- Pfizer 182.15 B
- Johnson & Johnson 180.88 B
- GlaxoSmithKlein 141.87 B
- Roche Holding 135.28 B
- Novartis 128.65 B
- Sanofi-Aventis 122.80 B
- Astra Zeneca 75.70 B
- Merck 72.71 B
- Eli Lilly & Co. 64.67 B
- Wyeth 62.78 B

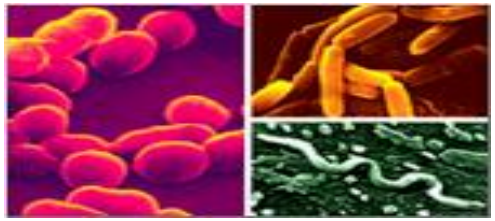
New Drug Application
The FDA

- FDA reviewer's key decisions:
  - "Whether the drug is safe and effective in its proposed use(s), and whether the benefits of the drug outweigh the risks.
  - Whether the drug's proposed labeling (package insert) is appropriate, and what it should contain.
  - Whether the methods used in manufacturing the drug and the controls used to maintain the drug's quality are adequate to preserve the drug's identity, strength, quality, and purity."

Source: www.fda.gov

Pre Clinical Tests

- The beginning of the drug approval process
- To see the potential effects on humans, tests are performed on:
  - Isolated tissues
  - Cell Cultures
  - Animals

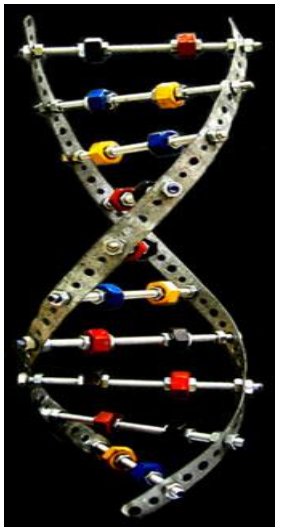


- Company decides whether to put the drug into the human testing process, based on the marketability of the product, their financial situation
- On average, only one compound in a thousand will actually make it to human testing

The IND Filing

- The goal is to provide pre-clinical data of sufficient quality to justify the testing of the drug in humans
- FDA has 30 days to review the Investigational New Drug (IND) application
- Must be filed annually until the completion of clinical testing
- At this time patents are usually applied for; patents last generally for 20 years
- About 85% of all IND applications move on to begin clinical trials
- If they succeed, 20% chance of the product making it to the market

Phase I



- Duration: 1 to 3 years
- Sample size: less than 100 patients
- Test on: Healthy volunteers
- If passed this Phase, chances of the product reaching to the market will be 30%
- Begins to analysis and develop the drugs safety profile
- How the drug is absorbed, metabolized and excreted

Phase II

- Duration: 2 years
- Sample size: 100 – 300 patients
- Test on volunteers who suffer from the disease
- Upon passing this Phase, chances of the product reaching to the market will be 60%
- To evaluate the drug's safety and assess side effects
- Establishes the optimal dosage of the drug

Phase III

- Duration: 3-4 years
- Sample size: >1000 patients
- Test on volunteers who suffer from the disease
- If passed this phase, chances of the product reaching to the market will be 70%
- Verifies the drug’s effectiveness in its intended use
- Assessment of long term effects

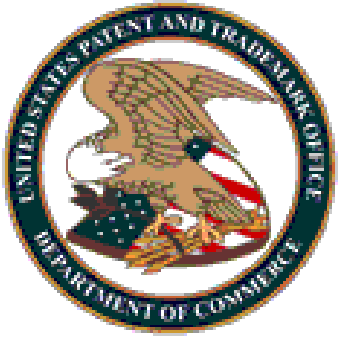
NDA Filing

- Upon desirable results from Phase III, New Drug Application (NDA) will be submitted
- NDA contains data supporting the efficacy and safety of the drug
- Approval can take 2 month to several years, but on average, it takes around 18 to 24 months
- Drugs are subject to ongoing review, making sure no adverse side effects appear from the drug.
- After FDA's approval, the drug can be marketed and distributed

Patent

- Generally last 20 years
- Since most companies file for patent during pre-clinical trials, usually the patent is only good for another 10 years or so after it gains FDA approval
- What can be patented
  - Product
  - Method
  - Use

- Examples
  - DNA and RNA sequences
  - Proteins, enzymes, antibiotics
  - Antibodies, antigens
  - Micro-organisms, cell lines, hybrids



Drug Approval Process

- Average of 10 - 15 years and $800 million - $1 billion to nurture a drug from initial discovery to market

Process:

  - Academic and Laboratory Research
  - Testing done on animals
  - **Phase 1:** Drug given to a small number of healthy people to test its safety
  - **Phase 2:** Drug administered to 100 or more people with the disease that it was intended to treat
  - **Phase 3:** Rigorous testing done on larger groups of ill patients
  - FDA Review – Approval/Disapproval

Drug

A drug product consists of therapeutics and excipients combined in a delivery system. A drug product's success lies in its ability to deliver the drug at a certain rate in a certain environment in the body.

Manufacture

Regulations

U.S. Food and Drug Administration

FDA — Department of Health and Human Services

"FDA's responsibility is to protect the American public. In terms of products that are developed by a technology--whether it's a new technology or a conventional technology--our role is to ensure that the products are safe. Our role is not really to make a judgment about whether they should be placed in the marketplace or not. . . . We are here as the gatekeeper to close the gate if a product is not going to be safe for consumers. . . . "

GMP regulations address issues including record keeping, personnel qualifications, sanitation, cleanliness, equipment verification, process validation, and complaint handling.

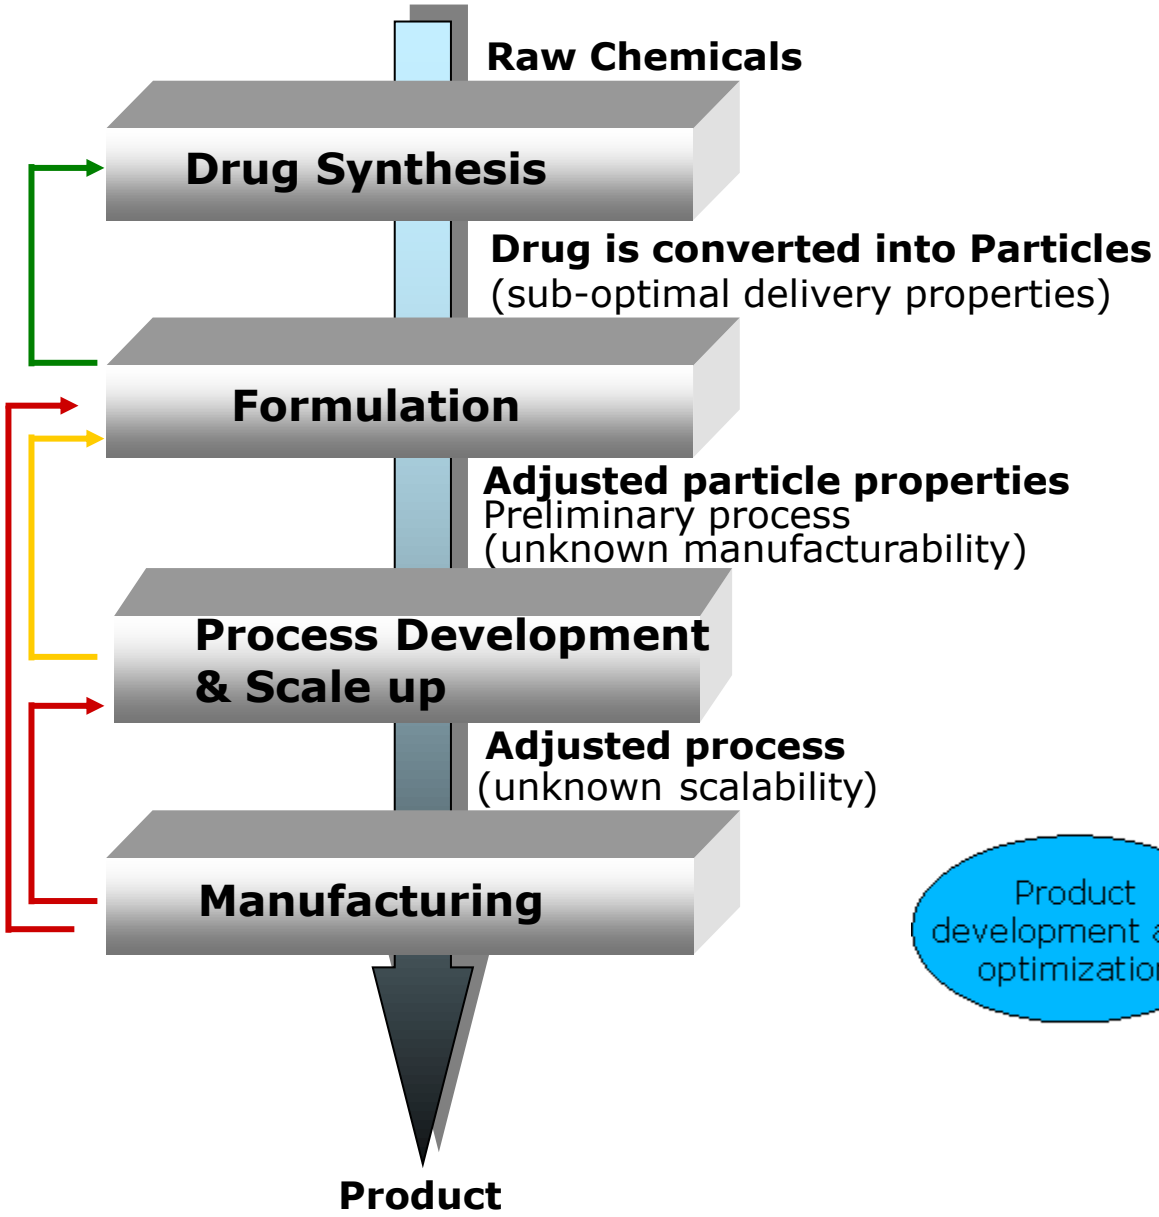
Types of Tablets (>80% of Total Products)

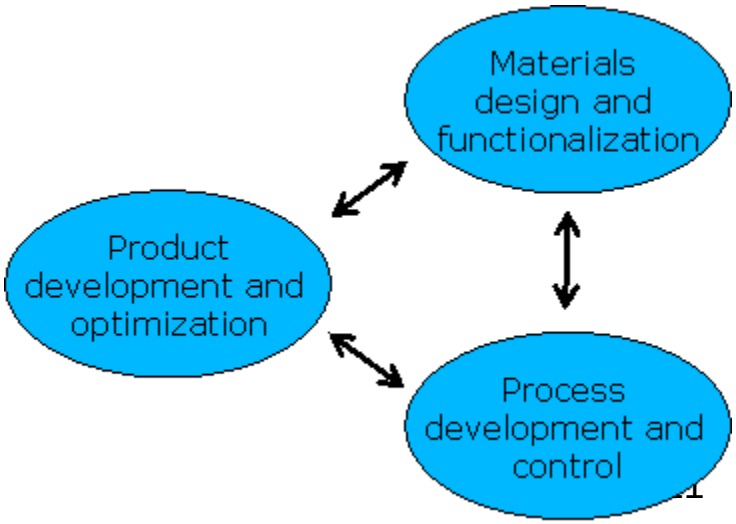
- **Compressed tablets**
  – Multiple compressed tablets
- **Sugar - Coated tablets**
- **Film - Coated tablets**
  – Enteric coated tablets
- **Buccal or sublingual tablets**
- **Chewable tablets**
- **Effervescent tablets**
- **Hypodermic tablets**

Advantages

- **convenience of consumptiom**
- **shelf-life (stability)**
- **economics of manufacturing**
- **patient acceptance**

Product/Process Development Paradigm





Application of FBs in Pharmaceutical Industry

- Blending
- Drying
- Spray-drying
- Granulation
- Coating
- Pelletizing
- Adsorption

- High mass and heat transfer
- Billions of dollars on fluidized bed processes each year

http://www.uic.edu/depts/chme/UnitOps/Fluidized%20Beds.jpg

Coating

There are several types of coating method that are divided into two main categories: the single layer and the multi-layer coating methods. The first category is most commonly used for the pharmaceutical patches

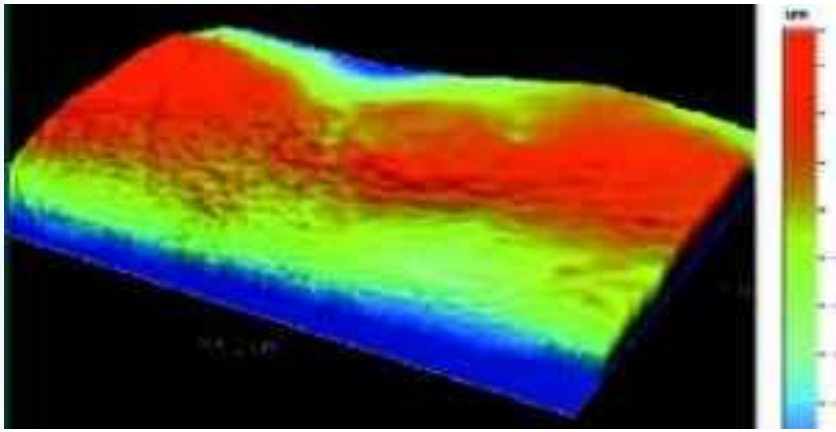
Some of the main variables involved in the selection of the appropriate method are:

- The number of layers
- Layer thickness
- Viscosity
- Solids content
- Accuracy
- Solvent systems
- Surface treatment and so on

http://www1.istockphoto.com/file_thumbview_approve/344351/2/istockphoto_344351_multi_macro.jpg

Coating Equipment

http://www.sono-tek.com/images/_biomedical/medicoat_header.jpg



http://www.medicaldesign.com/

The surface profile of a drug-eluting coating on a stent examined with an optical interferometer reveals some waviness in the coating, along with a lower region in the middle of the area examined

Talwar Pharma manufactures a wide range of pellet products, mainly omeprazole and lansoprazole pellets, and offers stage wise quality tests at drug coating stage, sub-coating stage and enteric coating stage

Challenges in Pharmaceutical Industry

- Development cost is rising – 50% increase in five years
- Why is this happening?
  - New drugs are harder to formulate
  - Products are increasing in complexity
  - “Regulation is inefficient”

- Health care cost is rising rapidly
- Uninsured, underinsured, and third world populations cannot afford many new drugs
- Many drugs do not get developed because the economic incentive is not there
- Number of new drugs has decreased 50% in 10 years
